-1-

METHODS AND COMPOSITIONS FOR TREATING ALLERGIC
DISORDERS USING OPTICALLY PURE (+) CETIRIZINE

BACKGROUND OF THE INVENTION

5 This invention relates to novel compositions of
matter containing optically pure (+) cetirizine.
These compositions possess potent activity in
treating seasonal and perennial allergic rhinitis,
the symptoms of allergic asthma, chronic idiopathic
urticaria, some types of physical urticaria, and
10 other disorders including those that would benefit
from an inhibitory action on eosinophil function.
(+) Cetirizine inhibits eosinophil chemotaxis and
function and the generation of cytotoxic mediators by
blood platelets, providing therapy in
15 immunologically-induced asthma with particular
utility in the late phase of the disease episode.
Optically pure (+) cetirizine provides this treatment
while avoiding adverse effects, including, but not
limited to, sedation and somnolence, headache,
20 gastrointestinal disturbance, anticholinergic
effects, dizziness, cardiac arrhythmias and other
cardiovascular effects which are associated with the
administration of the racemic mixture of cetirizine.
Also disclosed are methods for treating the above
25 described conditions in a human while avoiding the
adverse effects that are associated with the racemic
mixture of cetirizine by administering the (+) isomer
of cetirizine to said human.

30 The active compound of these compositions and
methods is an optical isomer of cetirizine, the
preparation of which is described in United States

-2-

Patent No. 4,525,358 (Baltes et al.). The medicinal chemistry of cetirizine is described by Campoli-Richards et al., [Drugs 40, 762-781 (1990)], Snyder and Snowman [Allergy 59 II, 4-8 (1987)], and Rihoux and Dupont [Annals of Allergy 59, 235-238 (1987)]. Chemically, the active compound is the (+) isomer of 2-[4-[(4-chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxyacetic acid, hereinafter referred to as cetirizine.

10 (+) Cetirizine, which is the subject of the present invention, is not presently commercially available; only the 1:1 racemic mixture is commercially available as its dihydrochloride salt.

15 Many organic compounds exist in optically active forms, i.e. they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The
20 prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. There is no correlation
25 between nomenclature for the absolute stereochemistry and for the rotation of an enantiomer. Thus, D-lactic acid is the same as (-) lactic acid, and L-lactic acid is (+). For a given chemical structure, these chiral compounds exist as a pair of enantiomers
30 which are identical except that they are non-superimposable mirror images of one another. A specific stereoisomer may also be referred to as an

-3-

enantiomer, and a mixture of such isomers is often called an enantiomeric or racemic mixture.

5 Stereochemical purity is of importance in the field of pharmaceuticals, where 12 of the 20 most prescribed drugs exhibit chirality. A case in point is provided by the L-form of the beta-adrenergic blocking agent, propranolol, which is known to be 100 times more potent than the D-enantiomer.

10 Furthermore, optical purity is important since certain isomers may actually be deleterious rather than simply inert. For example, it has been suggested that the D-enantiomer of thalidomide was a safe and effective sedative when prescribed for the control of morning sickness during pregnancy, while 15 the corresponding L-enantiomer has been believed to be a potent teratogen. The synthesis of (+) cetirizine and (-) cetirizine are described in British application 2,225,321, but no pharmacology of individual enantiomers is reported.

20 The racemic mixture of cetirizine is presently used primarily in seasonal and perennial allergic rhinitis. The symptomatology of immediate-type allergic diseases, including allergic rhinitis, presumably results from the antigen-induced release 25 of various pharmacologically active substances from mast cells, and from basophilic leukocytes. The substances thus released from these cells, and possibly others as well, are referred to as primary mediators of anaphylaxis and include, among others, 30 histamine. The acute seasonal form of allergic rhinitis, hay fever, and perennial allergic rhinitis

-4-

are characterized by sneezing, rhinorrhea, nasal congestion, pruritus, conjunctivitis and pharyngitis. In acute seasonal rhinitis, the nose, roof of the mouth, eyes and pharynx often itch, and lacrimation, sneezing and clear, watery nasal discharge follow the pruritus. Additionally, frontal headaches, irritability, anorexia, depression and insomnia may occur. In perennial rhinitis, chronic nasal obstruction is often prominent and may extend to eustachian tube obstruction. For most patients, topical corticosteroids, some aerosol vasoconstrictor agents, and long acting antihistamine agents provide significant relief of symptoms. The action of cetirizine on non-immunologically (non IgE) mediated hypersensitivity reactions has been less clear although there are some suggestions of activity in the treatment of exercise induced asthma, cold urticaria, and non-specific bronchial hyperreactivity.

Racemic cetirizine dihydrochloride is an orally active, potent, long acting peripheral histamine H_1 receptor antagonist. The compound is one of the second generation of H_1 histamine receptor antagonists which generally offer some significant advantages beyond the first generation compounds. The advantages include (1) less sedation, (2) little anticholinergic activity and (3) longer duration, which improves patient compliance. In addition to being competitive inhibitors of histamine at the end organ site, second generation H_1 histamine inhibitors appear to have other anti-allergic pharmacologic mechanisms which have led to their use in bronchial

-5-

asthma, as well as in seasonal and perennial rhinitis and the chronic urticarias.

Experiments ex vivo suggest that racemic cetirizine does not significantly penetrate the blood
5 brain barrier. It has been suggested therefore that cetirizine's ability to provide a reduced incidence of sedative side effects may result in part from its receptor selectivity and in part from its relative exclusion from the CNS. Other experiments have
10 suggested that cetirizine does not inhibit mast cell activation but rather that it antagonizes the action of histamine once released from the mast cell following antigen or chemical stimulation. There are also reports that racemic cetirizine inhibits the
15 degranulation of human basophils induced by anti IgE. Cetirizine has been shown to inhibit the chemotaxis of eosinophils to the tissues where they would otherwise contribute to the pathogenesis of asthma.

Cetirizine is rapidly absorbed upon oral
20 administration and although food may slightly reduce the rate of absorption, the extent is not affected. The compound is bound to plasma proteins and peak cetirizine concentrations in the brain are less than 10% that of the plasma concentration. Cetirizine is
25 excreted in the urine largely as unchanged drug and the elimination half-life is roughly 7 to 10 hours.

The racemic mixture of cetirizine may be useful in treating other disorders such as allergic
pulmonary disease and particularly in treating the
30 symptoms of allergic bronchial asthma. Patients who suffer from allergic bronchial asthma develop such

-6-

clinical symptoms as wheezing and dyspnea after exposure to allergens, environmental irritants, viral infections, cold air and exercise. Many of the symptoms result from smooth muscle contraction and
5 vascular dilatation, which, in turn, result from mediator release when the antigen reacts with the IgE antibody on the surface of a mast cell or basophil. This serves as a basis for the use of histamine H₁ antagonists.

10 In addition, racemic cetirizine may be useful for treating chronic idiopathic urticaria and some types of physical urticaria. Urticaria is characterized by local wheals and erythema in the dermis; acute urticaria is essentially an anaphylaxis
15 that is limited to the skin and subcutaneous tissues. The condition may arise from food allergy, drug allergy, insect sting, or the like, and is distinct from chronic or idiopathic urticaria which may last for several weeks and can only rarely be associated
20 with a specific cause. Because these urticarias appear in many cases to be IgE antibody mediated, many of the symptoms may be treated with a histamine H₁ receptor antagonist such as cetirizine. The direct inhibition of eosinophil chemotaxis by cetirizine may
25 also provide therapy to the late phase of allergic episodes in disorders such as allergic asthma, allergic rhinitis, and in other conditions characterized by eosinophilia.

30 Many of the second generation histamine H₁ receptor antagonists offer advantages over the first generation of histamine antagonists in that there is reduced sedation and anticholinergic activity.

-7-

Nonetheless, some adverse effects remain, including, but not limited to, some incidence of sedation and somnolence; cardiovascular effects including arrhythmias; headache; gastrointestinal disturbances; 5 dizziness and nausea. The racemic mixture of cetirizine has been found to cause many of these adverse effects, including sedation and somnolence. Thus, it would be particularly desirable to find a compound with the advantages of the racemic mixture 10 of cetirizine which would not have the aforementioned disadvantages.

SUMMARY OF THE INVENTION

It has now been discovered that the optically pure (+) isomer of cetirizine is an effective agent 15 for treating seasonal and perennial allergic rhinitis, the symptoms of allergic asthma, chronic idiopathic urticaria, some physical urticaria, and other disorders, including those that would benefit from an inhibitory action on eosinophilia, and 20 eosinophil function. The optically pure (+) isomer of cetirizine provides this effective treatment while avoiding the adverse effects including, but not limited to, sedation and somnolence, headache, gastrointestinal disturbance, dizziness, nausea, 25 cardiac arrhythmias and other cardiovascular effects. The present invention also includes methods for treating the above described conditions in a human while avoiding the adverse effects that are associated with the racemic mixture of cetirizine by 30 administering the optically pure (+) isomer of cetirizine to said human.

-8-

DETAILED DESCRIPTION OF THE INVENTION

The present invention encompasses a method of treating the symptoms of seasonal and perennial allergic rhinitis in a human, which comprises
5 administering to a human in need of such symptomatic relief therapy, an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said
10 amount being sufficient to alleviate the symptoms of seasonal and perennial allergic rhinitis. The method avoids the concomitant liability of adverse effects associated with the administration of the racemic compound by providing an amount which is insufficient to cause the adverse effects associated with the
15 racemic mixture of cetirizine.

The present invention also encompasses an antirhinitis composition for the treatment of a human in need of antirhinitis therapy, which comprises an
20 amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said rhinitis but insufficient to cause the adverse effects associated with racemic cetirizine.

25 The present invention further encompasses a method of treating allergic asthma and chronic and physical urticaria in a human, which comprises administering to a human in need of such asthma or urticaria therapy, an amount of (+) cetirizine, or a
30 pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, sufficient to alleviate said asthma or urticaria.

-9-

The method avoids the concomitant liability of adverse effects associated with the administration of racemic cetirizine by providing an amount which is insufficient to cause adverse effects associated with the administration of racemic cetirizine.

In addition, the present invention encompasses an antiallergic and antiurticaria composition for the treatment of a human having allergic asthma, chronic idiopathic urticaria and some types of physical urticaria, which comprises an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) isomer, said amount being sufficient to alleviate or palliate said disorder but insufficient to cause adverse effects associated with the administration of racemic cetirizine.

A further aspect of the present invention includes a method of treating a condition caused by or contributed to by an eosinophilia or enhanced eosinophil function in a human, which comprises administering to a human in need of such therapy, an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, sufficient to alleviate said eosinophilia or enhanced eosinophilia function. The method avoids the concomitant liability of adverse effects associated with the administration of racemic cetirizine by providing an amount which is insufficient to cause adverse effects associated with the administration of racemic cetirizine. Conditions associated with an eosinophilia or an altered eosinophil function in humans may include, but are

-10-

not limited to, allergic asthma, seasonal allergic rhinitis, atopic dermatitis, some parasitic diseases, and chronic obstructive lung disease with no demonstrable evidence of allergic asthma. Moreover
5 accumulations of eosinophils in both the gastrointestinal and genitourinary tracts indicate the desirability of regulation of eosinophil function in disorders of these tracts.

Furthermore, the present invention includes a
10 composition for treating disorders associated with or enhanced by an eosinophilia or enhanced eosinophil function that would benefit from a potent inhibitor of eosinophil chemotaxis in a human which comprises an amount of (+) cetirizine, or a pharmaceutically
15 acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said condition associated with an eosinophilia or altered eosinophil function, but insufficient to cause adverse effects associated with
20 the administration of racemic cetirizine.

The available racemic mixture of cetirizine (i.e. a 1:1 racemic mixture of the two enantiomers) exhibits antihistaminic activity through its selective and potent binding to histamine H₁
25 peripheral receptor sites and causes inhibition of eosinophil chemotaxis thus providing therapy and a reduction of symptoms in a variety of conditions and disorders related to allergic rhinitis, allergic asthma, several types of urticaria, and conditions
30 related to eosinophilia; however, this racemic mixture, while offering the expectation of efficacy, causes adverse effects. Utilizing the optically pure

-11-

or substantially optically pure isomer of (+) cetirizine results in enhanced efficacy, diminished adverse effects, and accordingly, an improved therapeutic index. It is therefore, more desirable
5 to use the (+) isomer of cetirizine than to administer the racemic mixture.

The term "adverse effects" includes, but is not limited to, sedation and somnolence, headache, gastrointestinal disturbance, dizziness, nausea,
10 cardiac arrhythmias and other cardiovascular effects.

The term "substantially free of its (-) stereoisomer" as used herein means that the compositions contain a greater proportion of the (+) isomer of cetirizine in relation to the (-) isomer of
15 cetirizine. In a preferred embodiment, the term "substantially free of its (-) isomer" as used herein means that the composition comprises at least 90% by weight of (+) cetirizine and 10% by weight or less of (-) cetirizine. In a more preferred embodiment the
20 term "substantially free of the (-) isomer" means that the composition contains at least 99% by weight of (+) cetirizine, and 1% or less of (-) cetirizine. In the most preferred embodiment, the term "substantially free of its (-) stereoisomer" as used
25 herein means that the composition contains greater than 99% by weight of (+) cetirizine. These percentages are based upon the total amount of cetirizine in the composition. The terms "substantially optically pure (+) isomer of
30 cetirizine or "substantially optically pure (+) cetirizine" and "optically pure (+) isomer of cetirizine" and "optically pure (+) cetirizine" are

-12-

also encompassed by the above-described amounts.

The term "treating the symptoms of seasonal and perennial rhinitis" as used herein means treating, alleviating or palliating such conditions, and thus providing relief from the symptoms of sneezing, rhinorrhea, nasal congestion, pruritus, conjunctivitis, pharyngitis, lacrimation, frontal headaches, irritability, anorexia, depression, insomnia, eustachian tube obstruction, and the like.

The term "a method for treating allergic asthma and chronic and physical urticaria in a human" as used herein means treating, alleviating or palliating such conditions, and thus providing relief from the symptoms of wheezing, dyspnea, coughing, shortness of breath, respiratory mucus hypersecretion, airway inflammation, local cutaneous wheals, erythema, and the like.

The term, "treating a condition caused by, or contributed to, by an eosinophilia, or enhanced eosinophil function in a human" as used herein means treating, alleviating or palliating such disorders associated with an eosinophilia, thus providing relief from the symptoms of the aforementioned conditions. Allergic asthma, seasonal allergic rhinitis, atopic dermatitis, chronic obstructive lung disease, and symptoms associated with some parasitic diseases, gastrointestinal and genitourinary disorders are among the conditions caused by or contributed to by eosinophilia.

-13-

The chemical synthesis of the racemic mixture of cetirizine can be performed by the method described in U.S. Patent 4,525,358 cited above or by an improved procedure disclosed in British application 2,225,320. The (+) isomer of cetirizine may be obtained from its racemic mixture by resolution of the enantiomers of cetirizine or precursors thereto using conventional means such as an optically active resolving acid. For example, British application 2,225,321 (Cossement et al.), which is incorporated herein by reference, discloses a method for resolving the 1-[(4-chlorophenyl)phenylmethyl]piperazine precursor using tartaric acid in ethanol. Other standard methods of resolution known to those skilled in the art including, but not limited to, simple crystallization and chromatographic resolution, can be used. (See for example, E.L. Eliel, Stereochemistry of Carbon Compounds, McGraw Hill (1962) and [Wilens and Lochmuller "Tables of Resolving Agents" Journal of Chromatography 113, 283-302 (1975)]. Additionally, the optically pure (+) isomer can be prepared from the racemic mixture by enzymatic biocatalytic resolution. See for example U.S. Patent Nos. 5,057,427 and 5,077,217, the disclosures of which are incorporated herein by reference.

The magnitude of a prophylactic or therapeutic dose of (+) cetirizine in the acute or chronic management of disease will vary with the severity of the condition to be treated and the route of administration. The dose and perhaps the dose frequency will also vary according to the age, body weight and response of the individual patient. In general, the total daily dose range for (+)

-14-

cetirizine for the conditions described herein is from about 1.0 mg to about 25 mg in single or divided doses. Preferably a daily dose range should be about 2.0 mg to about 20 mg in single or divided doses while most preferably a daily dose range should be about 5 mg to about 10 mg in single or divided doses. In managing the patient, the therapy should be initiated at a lower dose, perhaps at about 2 mg to about 5 mg and increased up to about 10 mg or higher depending on the patient's global response. It is further recommended that children and patients over 65 years and those with impaired renal or hepatic function, initially receive low doses, and that they be titrated based on individual response(s) and blood level(s). It may be necessary to use dosages outside these ranges in some cases as will be apparent to those skilled in the art. Further, it is noted that the clinician or treating physician will know how and when to interrupt, adjust, or terminate therapy in conjunction with individual patient response. The terms "an amount sufficient to alleviate or palliate symptoms of seasonal and perennial allergic rhinitis but insufficient to cause said adverse effects," "an amount sufficient to alleviate or palliate the symptoms of allergic asthma and chronic and physical urticaria but insufficient to cause said adverse effects" and "an amount sufficient to alleviate or palliate the symptoms arising from the eosinophilia of allergic asthma, seasonal allergic rhinitis, atopic dermatitis, parasitic diseases, chronic obstructive lung disease, gastrointestinal and genitourinary disorders but insufficient to cause said adverse effects" are encompassed by the above-described dosage amounts and dose frequency schedule.

-15-

Any suitable route of administration may be employed for providing the patient with an effective dosage of (+) cetirizine. For example, oral, rectal, parenteral (subcutaneous, intramuscular, intravenous), transdermal, and like forms of administration may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, patches, and the like.

The pharmaceutical compositions of the present invention comprise (+) cetirizine as the active ingredient, or a pharmaceutically acceptable salt thereof, and may also contain a pharmaceutically acceptable carrier, and optionally, other therapeutic ingredients.

The terms "pharmaceutically acceptable salts" or "a pharmaceutically acceptable salt thereof" refer to salts prepared from pharmaceutically acceptable non-toxic acids or bases including inorganic acids and bases and organic acids and bases. Since the compound of the present invention is basic, salts may be prepared from pharmaceutically acceptable non-toxic acids including inorganic and organic acids. Suitable pharmaceutically acceptable acid addition salts for the compound of the present invention include acetic, benzenesulfonic (besylate), benzoic, camphorsulfonic, citric, ethenesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric acid, p-toluenesulfonic, and the like.

-16-

The compositions of the present invention include suspensions, solutions, elixirs, aerosols, or solid dosage forms. Carriers such as starches, sugars, microcrystalline cellulose, diluents, 5 granulating agents, lubricants, binders, disintegrating agents, and the like are suitable in the case of oral solid preparations (such as powders, capsules, and tablets), and oral solid preparations are preferred over the oral liquid preparations. The 10 most preferred oral solid preparation is a tablet.

Because of their ease of administration, tablets and capsules represent the most advantageous oral dosage unit form, in which case solid pharmaceutical carriers are employed. If desired, tablets may be 15 coated by standard aqueous or nonaqueous techniques.

In addition to the common dosage forms set out above, the compounds of the present invention may also be administered by controlled release means and delivery devices such as those described in 20 U.S. Patent Nos.: 3,845,770; 3,916,899; 3,536,809; 3,598,123; and 4,008,719, the disclosures of which are hereby incorporated by reference.

Pharmaceutical compositions of the present invention suitable for oral administration may be 25 presented as discrete units such as capsules, cachets, tablets, or aerosol sprays, each containing a predetermined amount of the active ingredient, as a powder or granules, or as a solution or a suspension in an aqueous liquid, a non-aqueous liquid, an oil- 30 in-water emulsion, or a water-in-oil liquid emulsion. Such compositions may be prepared by any of the

-17-

methods of pharmacy, but all methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more necessary ingredients. In general, the compositions
5 are prepared by uniformly and intimately admixing the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product into the desired presentation.

10 For example, a tablet may be prepared by compression or molding, optionally, with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as
15 powder or granules, optionally mixed with a binder, lubricant, inert diluent, surface active agent or dispersing agent. Molded tablets may be made by molding in a suitable machine, a mixture of the powdered compound moistened with an inert liquid
20 diluent. Desirably, each tablet contains from about 2 mg to about 10 mg of the active ingredient, and each cachet or capsule contains from about 2 mg to about 10 mg of the active ingredient. Most preferably, the tablet, cachet or capsule contains
25 either one of three dosages, about 2 mg, about 5 mg and about 10 mg of (+) cetirizine dihydrochloride for oral administration.

The invention is further defined by reference to the following examples describing in detail the
30 preparation of the compound and the compositions of the present invention, as well as their utility. It will be apparent to those skilled in the art, that

-18-

many modifications, both to materials, and methods, may be practiced without departing from the purpose and interest of this invention.

5

EXAMPLES

Example 1

The antihistaminic activity of the racemate and enantiomers of cetirizine is studied in receptor binding assays with washed guinea pig brain and lung tissue membranes following the procedure of Snyder and Snowman (op cit). The tissues are used to establish inhibitory concentration values expressed in micromolar concentration (IC_{50}) for racemic cetirizine and its enantiomers to inhibit the binding of tritiated mepyramine. The selection of these tissues provides information as to the binding at central and peripheral H_1 histamine receptors. The specificity of the H_1 -receptor binding may then be compared with the binding at radio ligand labeled receptors for other central mediators.

Example 2

The antihistaminic activity of the isomers of Cetirizine is also studied in vitro in the guinea pig ileum preparation described by Staff [Pharmacological Experiments on Isolated Preparations, E & S. Livingstone Ltd., Edinburgh (1968).]

-19-

Example 3

Cetirizine isomer activity is also studied in isolated guinea pig tracheobronchial smooth muscle preparation according to the method of Campoli-Richards, et al. [Drugs 40, 762-781 (1990)] and Wardell, et al. [J. Pharm. Exp. Ther. 167-184 (1974)]. These preparations demonstrate competitive antagonism to histamine-induced contractions in a model relevant to the inhibition of histamine-induced disorders in vivo. The primary antihistaminic activity is then compared to the relative anticholinergic activities ("adverse effects") of cetirizine in the same tissue. The anticholinergic activity is evaluated by challenging the tissue with a cholinergic agent.

Example 4

Single ventricular myocytes are obtained from isolated cat hearts by conventional techniques. The rod-shaped single cells are maintained in a HEPES buffer and they are "patch clamped" using suction pipettes. A Patch-Clamp L/M-PEC 7 amplifier is used to record current tracings, and the recording electrodes are filled with a solution of potassium aspartate. Voltage clamp pulses and data acquisition are controlled by a Sperry PC/IT Computer running P Clamp software. A minimum of 4 cells are studied at each test concentration of the following drugs: racemic cetirizine, (+) cetirizine, (-) cetirizine and quinidine (as a reference compound).

-20-

ORAL FORMULATION

Capsules:

5	Formula	Quantity per capsule in mg		
		A	B	C
	(+) Cetirizine	2.0	5.0	10.0
	Lactose	103.75	100.75	95.75
	Cornstarch	18.75	18.75	18.75
10	Magnesium Stearate	0.50	0.50	0.50
	Compression Weight	125.0	125.0	125.0

15 The (+) cetirizine, lactose and cornstarch are blended until uniform and then the magnesium stearate is blended into the resulting powder, which is sieved and filled into suitably sized, two-piece, hard gelatin capsules using conventional machinery. Other
20 doses may be prepared by altering the fill weight and, if necessary, changing the capsule size to suit.

-21-

ORAL FORMULATIONTablets:

5	Formula	Quantity per tablet in mg		
		<u>A</u>	<u>B</u>	<u>C</u>
	(+) Cetirizine	2.0	5.0	10.0
	Lactose	70.75	67.75	62.75
	Cornstarch	3.0	3.0	3.0
10	Water			
	(per thousand Tablets)*	30.0 mL	30.0 mL	30.0mL
	Cornstarch	18.75	18.75	18.75
	Magnesium Stearate	0.50	0.50	0.50
15	Compression Weight	125.0	125.0	125.0

*The water evaporates during manufacture

20 The (+) cetirizine is blended with the lactose until a uniform blend is formed. The smaller quantity of cornstarch is blended with the water to form the resulting corn starch paste. This is then mixed with the uniform blend until a uniform wet mass is formed. The remaining cornstarch is added to the

25 resulting wet mass and mixed until uniform granules are obtained. The granules are then screened through a suitable milling machine, using a 1/4 inch stainless steel screen. The milled granules are dried in a suitable drying oven until the desired

30 moisture content is obtained. The dried granules are then milled through a suitable milling machine,

-22-

magnesium stearate is blended in, and the resulting mixture is compressed into tablets of the desired shape, thickness, hardness and disintegration.

- Tablets of other strengths may be prepared by
- 5 altering the ratio of active ingredient to the excipients or to the final weight of the tablet.

-23-

What is claimed is :

1. A method of treating the symptoms of seasonal and perennial allergic rhinitis in a human which comprises administering to a human in need of such symptomatic relief therapy an amount of (+)
5 cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate or palliate said allergic rhinitis.
2. A method of treating the symptoms of seasonal and perennial allergic rhinitis in a human while avoiding the concomitant liability of adverse effects associated with racemic cetirizine which
5 comprises administering to a human in need of such symptomatic relief therapy an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate or palliate
10 said allergic rhinitis but insufficient to cause said adverse effects.
3. The method of claim 2 wherein (+) cetirizine is administered by intravenous infusion, transdermal delivery, or orally as a tablet or a capsule.
4. The method of claim 3 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof administered is from about 1 mg to about 25 mg per day.

-24-

5. The method of claim 4 wherein the amount administered is from about 2 mg to about 20 mg per day.

6. The method of claim 5 wherein the amount administered is from about 5 mg to about 10 mg per day.

7. The method of claim 2 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof is greater than approximately 90% by weight of the total weight of cetirizine.

8. The method of claim 2 wherein the amount of said (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a
5 pharmaceutically acceptable carrier.

9. The method according to claim 2, wherein (+) cetirizine is administered as a hydrochloride salt.

10. An antirhinitis pharmaceutical composition for the treatment of a human in need of rhinitis therapy which comprises an amount of (+) cetirizine or a pharmaceutically acceptable salt thereof,
5 substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said rhinitis.

11. An antirhinitis pharmaceutical composition for the treatment of a human in need of rhinitis therapy which comprises an amount of (+) cetirizine or a pharmaceutically acceptable salt

-25-

5 thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said rhinitis, but insufficient to cause adverse affects associated with the administration of racemic cetirizine.

12. A composition according to claim 11 wherein (+) cetirizine is administered as a hydrochloride salt.

13. A composition according to claim 11 wherein said composition is adapted for oral administration.

14. A composition according to claim 11 adapted for parenteral delivery.

15. A composition according to claim 14 adapted for intramuscular delivery.

16. A composition according to claim 11 adapted for transdermal delivery.

17. The composition according to claim 9 wherein (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a
5 pharmaceutically acceptable carrier.

18. A method of treating allergic asthma and chronic and physical urticaria in a human which comprises administering to a human in need of such therapy an amount of (+) cetirizine, or a
5 pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said

-26-

amount being sufficient to alleviate symptoms of allergic asthma and chronic and physical urticaria.

19. A method of treating allergic asthma and chronic and physical urticaria in a human, while avoiding the concomitant liability of adverse effects associated with racemic cetirizine, which comprises
5 administering to a human in need of such therapy an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to
10 alleviate symptoms of allergic asthma and chronic and physical urticaria but insufficient to cause said adverse effects.

20. The method of claim 19 wherein (+) cetirizine is administered by intravenous infusion, transdermal delivery, or orally as a tablet or a capsule.

21. The method of claim 20 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof administered is from about 1 mg to about 25 mg per day.

22. The method of claim 21 wherein the amount administered is from about 2 mg to about 20 mg per day.

23. The method of claim 22 wherein the amount administered is from about 5 mg to about 10 mg per day.

-27-

24. The method of claim 19 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof is greater than approximately 90% by weight of the total weight of cetirizine.

25. The method of claim 19 wherein the amount of said (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a
5 pharmaceutically acceptable carrier.

26. The method according to claim 19, wherein (+) cetirizine is administered as a hydrochloride salt.

27. An antiasthmatic or antiurticaria pharmaceutical composition for the treatment of a human in need of allergic or urticaria therapy which comprises an amount of (+) cetirizine or a
5 pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said allergy or urticaria.

28. An antiasthmatic or antiurticaria pharmaceutical composition for the treatment of a human in need of allergic or urticaria therapy which comprises an amount of (+) cetirizine or a
5 pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said allergy or urticaria, but insufficient to cause adverse effects associated with the administration of racemic
10 cetirizine.

-28-

29. A composition according to claim 28 wherein (+) cetirizine is administered as a hydrochloride salt.

30. A composition according to claim 28 wherein said composition is adapted for oral administration.

31. A composition according to claim 28 adapted for parenteral delivery.

32. A composition according to claim 31 adapted for intramuscular delivery.

33. A composition according to claim 28 adapted for transdermal delivery.

34. The composition according to claim 28 wherein (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a pharmaceutically acceptable carrier.

35. A method of treating a condition caused by or contributed to by eosinophilia or enhanced eosinophil function in a human, which comprises administering to a human, in need of eosinophilic therapy, an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said eosinophilia or enhanced eosinophil function.

-29-

36. A method of treating a condition caused by or contributed to by eosinophilia or enhanced eosinophil function in a human, while avoiding the concomitant liability of adverse effects associated with racemic cetirizine, which comprises administering to a human, in need of eosinophilic therapy, an amount of (+) cetirizine, or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said eosinophilia or enhanced eosinophil function but insufficient to cause said adverse effects.

37. The method according to claim 36 wherein said condition is selected from the group consisting of allergic asthma, seasonal allergic rhinitis, atopic dermatitis, parasitic disease, chronic obstructive lung disease with no demonstrable evidence of allergic asthma, gastrointestinal disease and genitourinary disease.

38. The method of claim 36 wherein (+) cetirizine is administered by intravenous infusion, transdermal delivery, or orally as a tablet or a capsule.

39. The method of claim 38 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof administered is from about 1 mg to about 25 mg per day.

40. The method of claim 39 wherein the amount administered is from about 2 mg to about 20 mg per day.

-30-

41. The method of claim 40 wherein the amount administered is from about 5 mg to about 10 mg per day.

42. The method of claim 36 wherein the amount of (+) cetirizine or a pharmaceutically acceptable salt thereof is greater than approximately 90% by weight of the total weight of cetirizine.

43. The method of claim 36 wherein the amount of said (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a
5 pharmaceutically acceptable carrier.

44. The method according to claim 36, wherein (+) cetirizine is administered as a hydrochloride salt.

45. A pharmaceutical composition for the treatment of a condition caused by or contributed to by eosinophilia or enhanced eosinophil function in a human which comprises an amount of (+) cetirizine or
5 a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said condition.

46. A composition for the treatment of a condition caused by or contributed to by eosinophilia or enhanced eosinophil function in a human which comprises an amount of (+) cetirizine or a
5 pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, said amount being sufficient to alleviate said condition,

-31-

but insufficient to cause adverse affects associated with the administration of racemic cetirizine.

47. A composition according to claim 46 wherein said condition is selected from the group consisting of allergic asthma, seasonal allergic rhinitis, atopic dermatitis, parasitic disease, chronic
5 obstructive lung disease with no demonstrable evidence of allergic asthma, gastrointestinal disease and genitourinary disease.

48. A composition according to claim 46 wherein (+) cetirizine is administered as a hydrochloride salt.

49. A composition according to claim 46 wherein said composition is adapted for oral administration.

50. A composition according to claim 46 adapted for parenteral delivery.

51. A composition according to claim 50 adapted for intramuscular delivery.

52. A composition according to claim 46 adapted for transdermal delivery.

53. The composition according to claim 46 wherein (+) cetirizine or a pharmaceutically acceptable salt thereof, substantially free of its (-) stereoisomer, is administered together with a
5 pharmaceutically acceptable carrier.

INTERNATIONAL SEARCH REPORT

Int. l. Application No

PCT/US 93/08999

A. CLASSIFICATION OF SUBJECT MATTER
IPC 5 A61K31/495

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 5 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	GB,A,2 225 321 (UCB) 30 May 1990 see examples 2-3 ---	1-53
A	EP,A,0 058 146 (UCB,S.A.) 18 August 1982 see the whole document & US,A,4 525 358 cited in the application ---	1-53
X	SCHWEIZ.MED.WOCHENSCHR. vol. 120, no. 5, 3 February 1990 pages 131 - 134 E.J.ARIENS 'STEREOSELECTIVITY IN PHARMACODYNAMICS AND PHARMACOKINETICS' see the whole document --- -/--	1-53

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents :

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

& document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 93/08999

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claims 1-9, 18-26 and 35-44 are directed to a method of treatment of the human/animal body the search has been based on the alleged effects of the compound.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
